Experimental Results

Conclusion

- Patients in hospital may suffer decompensation
- Fail to detect:
 - Nurses have too much workload³
 - Constantly observable information is insufficient for decision making⁴
 - General ward is usually harder setting than ICU⁵
- Consequences:
 - Unplanned transfers, delayed transfers⁶ to ICU increase mortality and length of stay⁷

Backgroud

DUHS Inpatient General Decompensation Prediction

Ziyuan Shen, Mengxuan Cui

Background & Significance

Data Preparation

Feature Engineering & Modeling

Experimenta Results

Conclusion

Patients show physiologic derangement 6-24 hours prior to deterioration $^{8}. \label{eq:constraint}$

Current Strategies:

- Risk Scores
 - National Early Warning Score (NEWS)
 - Rothman Index (RI), etc
- Machine Learning (ML) algorithms
 - Logistic Regression
 - Random Forest
 - Artificial Neural Network (ANN), etc

Baseline Model: National Early Warning Score

Table: NEWS scoring criteria as a aggregate weighted system⁹.

Score	3	2	1	0	1	2	3
Respiration Rate	≤ 8		9-11	12-20		21-24	\geq 35
Oxygen Saturations	\leq 91	92-93	94-95	\geq 96			
Supplemental		Yes		No			
Oxygen							
Systolic BP	\leq 90	91-100	101-110	111-219			\geq 220
Heart Rate	\leq 40		41-45	51-90	91-110	111-130	≥ 131
Temperature	\leq 35		35-36	36-38	38-39	\geq 39	
Level of				۸			VPII
Consciousness				~			V,I,O
